

ABZAC radial tubes

The AZ RC range

Applications

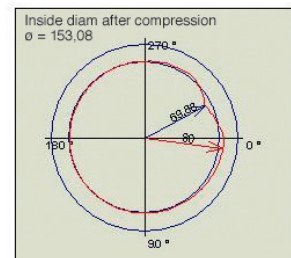

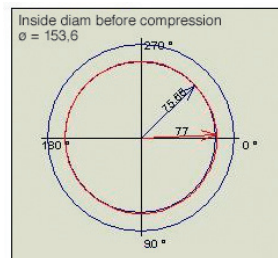

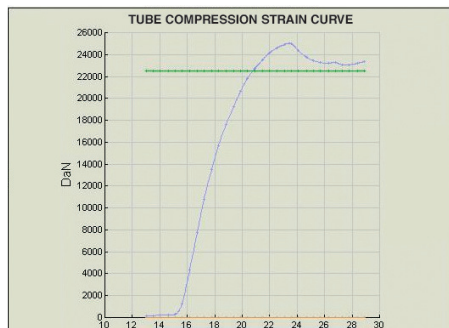

Designed for the **winding of industrial films**.

The manufacturing process used for radial tubes enables **full control of the radial compression strength** specific to the winding of films, namely the uniform pressure applied to the entire circumference of the tube.

The radial technical approach provides a precise answer to our customers' demands:

- > In cooperation with its supplier partners, ABZAC has developed a raw material meeting the specific constraints to which tubes are subjected;
- > ABZAC's laboratory is equipped with the necessary tools and equipment to simulate the radial effect and for the development and quality control of the tubes.

The end result is guaranteed thanks to the mastery of the raw material combined with **measurement capacity** and specific manufacturing and quality control processes.

100% recycled board, less waste = ☺ for the environment

Customer advantages

- > A function-designed product which reduces waste
- > Lower overall cost:
 - standardisation of references
 - source of savings through the redesign of the products (reduced thickness)
 - simplified stock management
- > A positive approach for the environment
